**"Metaheurísticas Híbridas Seqüenciais e Paralelas para Resolver o *Orienteering Problem*"**

In this work, parallel and sequential GRASP metaheuristics for approximate solutions to a generalization of the Traveling Salesman Problem called The Orienteering Problem (OP) are presented. Although OP is a problem of practical use, few works in this area present heuristic algorithms for solving this. Our partial results show that the algorithms proposed present good results concerning quality of solutions and also execution times.
