"Fadd - Um Framework para a Construção de Bases de Conhecimento Add"

The growing use of knowledge bases to perform tasks that demand specialists knowledge and the recent use of intellectual capital by enterprises as means of differential and longevity on the market has researches on knowledge acquisition field with the purpose to diminish the subjectivity and the construction time of these bases. When a knowledge base is used on knowledge-based system it is only software with some special characteristics. From this point of view it is easy to conclude that the Software Engineering has a lot of contributions to offer to the corrent software implementation. This way this Software Engineering techiques to systemize the knowledge base construction. On this context it is defined a framework called FADD that makes possible to systemize the construction of certain type of knowledge base. Thus we decided that FADD would implement a knowledge base of type ADD on same way that every framework is built for a specific kind of application.
